

ASK YOUR DOCTOR IF GAS DRILLING IS RIGHT FOR YOU.

WARNING: gas drilling near your home may put you at risk for possible exposure to carcinogens, neurotoxins, and endocrine disruptors by inhalation, ingestion, and absorption; elevated ground level ozone and air pollution in gas production areas due to toxic fumes and diesel exhaust; disease caused by chemicals, hydrocarbons, radium, and heavy metals in your drinking water; adrenal gland dysfunction from the low frequency noise of compressor stations; and potential for explosion due to methane accumulation in your home.

KEEP AWAY FROM CHILDREN, PREGNANT WOMEN, THE ELDERLY, AND PETS.

Symptoms can include, but are not limited to, headaches, nose bleeds, eye and skin damage, gastrointestinal problems, respiratory problems, dizziness, and confusion.

PHYSICIANS REPORT that methane, Ethylbenzene, m,p-Xylene, Hexane, 2 Methylpentane, and 3-Methylpentane have been detected in their patients' blood.

RELATED SERIOUS SIDE EFFECTS in gas extraction, processing, and production areas can be expected, including permanent neurological damage, cancer, brain damage, and endocrine system disruption.

The Medical Society of the State of NY and The American Academy of Pediatrics of NY have gone on record to express their concern about the effects of gas drilling on public health and the environment. Full scale, long-term epidemiological health studies must be conducted in affected areas to assess all of the dangers.
